

How the App Works (After Login)

Haryana Police Inventory Management System

<https://hp-inventory.vercel.app>

1. The Main Screen

After logging in, you see the app window with three main parts:

- **Left sidebar** — menu with [Dashboard](#), [Inventory](#), [Transactions](#), [Demands](#), [Inspections](#), [Allotments](#), [Reports](#). Click any item to switch screens.
- **Top bar** — District selector, notification bell , your name and role badge, and (for admins) the [Districts](#) and [Users](#) buttons, plus [Logout](#).
- **Main area** — the content of the selected screen (cards, tables, filters).

Sidebar collapse: click the  icon in the top bar to shrink / expand the sidebar — handy on small screens.

2. Dashboard

An overview screen with clickable summary cards and two quick tables. Clicking a summary card opens a detail table showing exactly what that card counted, with a search box and **PDF / Excel / Word / Print** export options.

- **Summary cards** — Total Items, Total Quantity, Low Stock Alerts, Categories, plus one card for each condition state: **New, Good, Fair, Poor, Damaged**. Click any card to open its detail view.
- **Low Stock table** — items that are at or below the minimum stock level, so you know what to re-order.
- **Recent Transactions** — latest additions/removals/transfers; click [View All](#) to open the full Transactions screen.
- Both tables show a **Total** row at the bottom summing the quantity column.

3. Inventory

Master list of all items and their quantities, locations, and condition.

- **+ Add Item** — add a new item (name, category, unit, min stock, location, condition). Enter the quantity for each condition state in the **Good / New / Fair / Poor / Damaged** boxes — the **Total Quantity** is calculated automatically, and the date added is recorded automatically (there is no manual quantity or date field).
- **Manage Categories** — all roles can view categories; showing the button is allowed for everyone.
- **Filters toolbar** — search by item name; filter by *category*, *location*, *condition*, and date-added range. Use **Clear** to reset.
- **Condition & status** — every item row shows its condition breakdown with a colour bar (Good / New / Fair / Poor / Damaged) and a stock status badge (**OK**, **Low**, or **Out**).
- **Export / Print** — click **Download / Print ▾** to save as PDF, Excel, or Word, or print the current list.
- Each row has an **Actions** button to edit or delete the item.
- The table shows a bold **Total** row at the bottom that sums the quantity column for the currently filtered list.

4. Transactions

Records every change of stock to keep a full audit trail with dates, locations, and the person responsible.

- **+ New Transaction** and choose a type:
 - **Addition (+)** — new stock received (external or from a location).
 - **Removal (-)** — stock issued / consumed / written off.
 - **Transfer** — moved between two locations.
- **Search & filter** — search box, date **From/To**, and **Type** filter; **Clear** resets.
- **Export / Print** — download the filtered list as PDF / Excel / Word, or print.
- **Correction workflow:** to fix a transaction, click **Action** → propose new quantity/notes. The request goes to the other side (e.g. the receiving district) for approval. Once approved, the transaction shows an *Edited* badge. A transaction can be edited this way only once — further changes need a new transaction.

Transfer transactions are approved by the receiving party; this keeps both districts in agreement about what moved.

5. Demands

Formal requests for material from another district / post.

- [+ Raise Demand](#) — select item, quantity, category, condition, urgency (normal/urgent/critical), reason, and the destination district + location.
- **Summary cards** — click Total / Pending / Approved / Rejected to jump to that filtered list.
- **Search & filter** — by text, status, and date range.
- **Review demand (on the receiving side):** open a pending demand, see full details, then **Approve & Submit** or **Reject** (a rejection reason is required).
- **Export / Print** — download as PDF / Excel / Word or print.

When you raise a demand, the target district's admin receives a notification under the 🔔 bell, so they know to review it.

6. Inspections

Records of asset inspections (Routine / Special / Annual).

- [+ Add Inspection](#) — item/asset, inspected by, type, date, location, findings, recommendations, status.
 - **Summary cards** — Completed / Pending / Overdue counts; click to filter.
 - **Search & filter** — by text, type, and status.
 - **Export / Print** — PDF / Excel / Word / Print.
-

7. Allotments

Issue items to personnel and track returns. It works on one simple rule: **Total Qty = Available + Allotted + Damaged/Lost**. You can never allot more than what is currently available, and quantities can never go negative.

The screen has three tabs at the top:

- **Item Stock** — every item with **Total Qty**, **Available**, and **Allotted** figures. Use the search box, category filter, or the **All / Allotted / Available** dropdown (see below). Click any column heading to **sort**. The **Adjust Stock** button records adjustments. Each row shows **View**, and (if you may edit) **Edit** and **Adjust**. A bold **Total** row sums the quantity columns.
- **Allotted Items** — the full allotment register with the person's **Name**, **Post/Rank**, **BELT No.**, **Posting**, the **Item**, **Qty** still with the person, and **Date / Time / Status**.
- **Return History** — every recorded return with quantity, condition, who received it, and remarks.

Finding items in Item Stock

- **Search** — type into the search box; it looks across **item name**, **category**, **unit and location**. You can type several words, e.g. wireless pcs, and only rows matching all of them are shown.
- **Sort** — click **Item Name**, **Category**, **Total Qty**, **Available**, **Allotted** or **Status** to sort the table; click the same column again to reverse (▲/▼ shows the direction).
- **All / Allotted / Available** dropdown — **All Stock** shows everything, **Only Allotted** shows just items that are currently issued out (*allotted* > 0), and **Only Available** shows just items with stock still on hand (*available* > 0).

Issuing items

1. Click **+ Allot Item** at the top of the Allotments screen (or the Inventory screen).
2. In **Person details**, start typing a name or BELT number — matching personnel appear for instant fill. Otherwise enter name, post/rank, BELT number, and posting.
3. Under **Item details**, pick a **Category** first — only then does the **Item** drop-down unlock, showing just the items in that category. Choose the item; balance chips show its Total / Available / Allotted.
4. Enter the item **Quantity**. You can allot items from **different categories and quantities in one go**: press **+ Add Item** to add more rows (Category → Item → Qty each). You can also remove a row with the **x** in its corner.
5. If any quantity exceeds the available stock, you get the message *"Insufficient stock for ... Only X units available."*
6. Set date/time (usually today) and optional remarks, then press **Allot Items** — every row is issued together under one allotment.

After an allotment is done it is locked: you can only change the **quantity**. Person details, item, category, date, time, and remarks cannot be edited anymore.

Editing and cancelling an allotment

- [Edit](#) on an active allotment — only the **quantity** can be changed (never below what has already been returned). All other fields appear greyed-out/locked. Increasing the quantity re-checks available stock.
- [Cancel](#) — closes the allotment record and returns the remaining units to stock.

Processing a return

1. On an active allotment, click [Return](#).
2. Enter the **Return Quantity** (partial returns are allowed — it shows how many units are still to be returned).
3. Choose the **Condition** on return: **Good** (adds the units back to available), **Damaged**, **Lost**, or **Other**.
4. Save — the stock figures update immediately and the return appears in Return History. Returns that are damaged or lost are tracked separately in the **Damaged / Lost** columns.

Adjusting stock

[Adjust](#) (on the Item Stock tab) lets you record **Stock Added**, **Stock Correction (set total)**, **Written Off**, **Mark Damaged**, or **Mark Lost**. The corrected total can never be set below the units currently held (allotted + damaged + lost). Every adjustment is written to the item's transaction history.

Viewing details and history

- [View](#) on an item — **Currently Allotted To** (who holds it now) and its **Transaction History** (allotments, returns, adjustments).
- Click a person's **Name** in the Allotted Items list to see that person's **Currently Allotted Items** and **Returned / Settled Items**.

Search, filter, and export

- Allotted Items — search by name / belt / item / posting / rank, plus filters for **Category**, **Item**, **Posting**, **Rank**, **Status**, and date range; [Clear](#) resets everything.
- Each tab has [Download / Print ▼](#) — export the current list as **PDF**, **Excel**, or **Word**, or print it. Exports include the **Total** row.

Allotments respect the same role limits as the rest of the app: who can issue, edit, return, and cancel is controlled by the user's role, and station/post users only ever see their own location's data.

8. Scan & Import (OCR)

Automatically read a filled application / receipt document and let the app fill in an allotment for you — always with a human verification step before anything is saved. The button [Scan & Import](#) is available on both the **Allotments** and the **Inventory** screen; the [Scans](#) button shows every document you have imported.

Supported formats

Images (JPG / PNG / WebP / BMP), PDF (text or scanned), Word (DOCX), Excel (XLSX), and TXT / CSV. The reading is done **in your browser** — the file is not uploaded before you confirm it.

How it works

1. Click [Scan & Import](#), then click or drag a file onto the upload box.
2. Press [Scan Document](#). The app reads the document (progress is shown; the OCR model downloads once on first use) and automatically extracts person details — **Name, Post / Rank, BELT No., Posting** — and the **Items + Quantities** by matching against your item list.
3. The **Review & Verify** screen opens with every field pre-filled and **editable**. Correct anything the computer misread, add or remove item rows, and check the **Raw extracted text** panel if you want to compare with the original.
4. Only when you press [Verify & Insert Data](#) is anything saved: the person is created (if new), the allotment appears in **Allotted Items**, and item stock is reduced — exactly as if you issued it manually.
5. The original document is stored with the record. Open [Scans](#) → [View](#) to see or download the original file, the person it was issued to, the items, date, and who verified it.

Items are matched by name, so scanned items must already exist in your inventory to be recognised. A quantity that exceeds available stock is blocked at verification, just like a manual allotment. The scan is only saved after human verification — nothing is ever inserted automatically without your confirmation.

9. Reports

Three ready-made reports. Switch with the tabs at the top of the screen. Reports respect your role — for example, a post or station user only ever sees their own location's data in every report and export.

- **Stock Report** — current stock position by item, with six clickable summary cards: **Total Items**, **In Stock**, **Low Stock**, **Out of Stock**, **New Units**, and **Damaged Units**. Click any card to open a detail table of exactly those items, with a search box and **PDF / Excel / Word / Print** export.
- **Category Breakdown** — items grouped by category with quantities.
- **Location Report** — stock grouped by location / station.
- **Search** — type in the search box to filter the current report instantly.
- **Sort** — click any column heading to sort; click again to reverse the order.
- **Download / Print** ▾ — export the report as **PDF**, **Excel**, or **Word**, or print it.
- Every report table has a bold **Total** row at the bottom summing its quantity columns; when you export a report or a card's detail view, the total row is included in the PDF / Excel / Word file and in Print.

10. Notifications (Bell)

Click the bell in the top-right corner to open the notifications panel. The red number shows unread items.

- See new demands, access requests, approvals/rejections, and password-reset requests.
- Use [Mark all read](#) to clear the counter.
- Admins can act directly on some notifications (e.g. approve an access request right from the panel).

Notification scope: the Developer Admin sees notifications across all districts (up to 30), while other users see only their own district (up to 20).

11. Users & Districts (Admin Options)

- [Users](#) — create, edit, or remove user accounts and their roles. When you edit a user you may set a new password (leave blank to keep the current one).
- [Districts](#) — manage districts and their locations/stations (devadmin).
- **District selector** — devadmin can switch the district being viewed; other users are locked to their own district.

Only create accounts for people who genuinely need access. Admin accounts are powerful — never create admin accounts for general staff.

12. Roles at a Glance

Role	Typical use
Developer Admin	Everything, all districts, user + district management.
District Admin	Full control within own district; manages that district's users & demands.
Station Manager	Manages station-level inventory, transactions, and allotments in own district.
MHC	Records material/MHC entries, inspections, and can allot and process returns.
TSI	Telecom / Signals inventory operator within their district.
Police Post	View/manage inventory, transactions, and allotments for a post.
General User	Viewing data for their district; can raise demands.

13. Good Practices

- Always press [Logout](#) on shared devices.
- Keep your password private — it is stored hashed and cannot be read by anyone.
- Use [Forgot Password?](#) on the login screen if you need a reset; the admin is notified automatically.
- Wrong login? Passwords are checked server-side; repeated failures are rate-limited for your protection.
