

How the App Works (After Login)

Haryana Police Inventory Management System

Runs on your own computer — usually `http://localhost:3210`

Before You Start — Opening the App

This app runs on the computer it is installed on. There is no online website and no internet connection is needed after the first start.

1. Open the project folder and double-click `run-local.bat` (on other systems, run `npm start`).
2. A black console window opens and must stay open. That window **is** the app server — closing it stops the app.
3. Your browser opens automatically. If it does not, look at the **App:** line in the console and open that address — it is usually `http://localhost:3210`. If that port is already in use the server picks the next free one, so always open the exact address it prints.
4. When you finish, click the console window and press **Ctrl+C** to stop the server.

Where your data lives: everything is stored in one file — `local-data\db.json` in the project folder. To back up, copy that file somewhere safe. To start fresh, delete it and restart the server; the app then re-seeds its default data.

Using it from a phone or another computer: start the server on the main computer, then on the other device open `http://<main computer's IP>:3210`. To find that IP, run `ipconfig` on the main computer and read *IPv4 Address* (for example `192.168.1.5`). Both devices must be on the same office network, and the main computer must stay switched on.

Signing In — Default Logins

A fresh local install seeds itself with the accounts below. Use them to open the app on your own computer straight away.

Username	Password	Role	District
developer	dev@123	Developer Admin	Gurugram
admin	admin123	District Admin	Gurugram
admin2	admin123	District Admin	Faridabad
user	user123	General User	Gurugram
mhc	mhc123	MHC	Gurugram
station	station123	Station Manager	Gurugram
fbf_user	user123	General User	Faridabad
fbf_mhc	mhc123	MHC	Faridabad

Change these before you put any real data in. Sign in as **developer**, open **Manage** ▾ → **Users**, edit each account and set a new password. Passwords are stored hashed — nobody, not even the Developer Admin, can read them back. In demo mode these seeded accounts also appear as one-click quick-login buttons under the login form.

1. The Main Screen

After logging in you see the app window with three main parts:

- **Left sidebar** — nine screens: [Dashboard](#), [Inventory](#), [Consumable Items](#), [Distribution](#), [Item Issued](#), [Demands](#), [Maintenance](#), [Inspections](#) and [Reports](#). Click any one to switch screens.
- **Top bar** — District selector, the gold [Manage](#) ▾ menu (Districts / Users / Locations), a **हिन्दी / English** language button, the notification bell 🔔, your name and role badge, and [Logout](#).
- **Main area** — the content of the selected screen (cards, charts, tables, filters).
- **Red dot on a sidebar item** — something needs your attention there (a request to approve, a distribution assigned to you, a maintenance job). The dot disappears once you act.
- **Long lists** — every record list shows up to **30 rows per page**. Under the table you see “Showing X–Y of Z rows” with ◀ **Prev** and **Next** ▶ buttons and page numbers; click a number to jump straight to that page. Filtering or searching starts again from page 1.

Sidebar collapse: click the ☰ icon in the top bar to shrink / expand the sidebar — handy on small screens.

2. Dashboard

The landing screen: clickable summary cards, two charts, and two quick lists. Clicking a summary card opens a detail table of exactly what that card counted, with a search box and **PDF / Excel / Word / Print** export.

- **Summary cards** — **Total Items**, **Total Quantity**, **Low Stock Alerts**, **Categories**, and one card per condition state: **Scrap**, **Damaged**, **Good**. Click any card to open its detail view.
- **Charts** — **Stock by Category** (top 8 categories) and **Condition Health** (units split by condition). Both refresh as data changes.
- **Low Stock Items** — items at or below their minimum level, so you know what to re-order. Columns: Item, Category, Current, Min Required, Reorder, Condition, Status — click any column heading to sort. Click [View All](#) to go to the Inventory screen.
- **Recent Activity** — a live feed of what is happening in the system right now, with a **Live** indicator; new events appear here by themselves.

Condition states are called **Good**, **Damaged** and **Scrap** throughout the app.

3. Inventory

The master list of durable items and their quantities, locations and condition.

- Top buttons — [+ Add Stock](#) , [Import from Excel](#) , [Documents](#) , [Manage Categories](#) .
- Two tabs — **Item Stock** (current stock) and **Stock History** (every stock change, with the previous and new figure).

Item Stock tab

- Filters — a location selector (**All Locations**), a search box, **All Categories**, and **All Stock / Only Issued / Only Available**.
- Columns — S.No, Item Name, Category, Total Qty, Available, Issued, Lost, Damaged, Scrap, Status, Actions. A bold **Total** row sits at the bottom.
- Each row has an **Actions** button (view, edit, adjust stock, and more depending on your role). Clicking the blue **item name** opens the item's full profile (section 10).

Stock History tab

- Filters — **All Categories**, **All Locations**, **All Conditions** (Good / Damaged / Scrap), plus a search box and [Clear](#) .
- Columns — Item Name, Category, Stock Change, Unit, Min Stock, Location, Condition, Status, Last Updated, Actions.

Use [Import from Excel](#) to load many items at once from a spreadsheet, and [Documents](#) to reach the attached document list.

4. Consumable Items

Stock that gets **used up** — paper, fuel, cartridges and similar. It is a separate catalogue from the Inventory items, and every hand-over needs the receiving side's approval.

- Top buttons — [+ Add Consume Item](#), [Manage Categories](#).
- Two tabs — **Item Consume** (current stock) and **Consume History** (the full ledger).

Item Consume tab

- Columns — S.No, Item Name, Category, Total Qty, Available, Distributed, Lost, Status, Actions. A **Total** row appears at the bottom.
- Filters — search, **All Categories**, **All Locations**, and **All Stock / Only Distributed / Only Available**.
- Row actions — **View**, plus **Distribute** and **Mark Lost** where applicable.
- A strip above the table shows the running figures: Total Quantity, Available (in stock now), Added/Received, Distributed and Lost.

Consume History tab

- First table — Item Category, Item, Quantity, Date of Distribution, Distributed To, Distributed By, Status, Actions. Filters: search, **All Categories**, **All Items**, **All Status** (Available / Pending Approval / Complete / Rejected / Lost), **All Locations**, and a date range.
- Second table, **Distribution by Location** — Recipient, Type, Category, Item, Quantity, Date, Distributed By, Status, Actions.

How to hand over a consumable

1. On **Item Consume**, click **Actions** → **Distribute**, enter the quantity, search and pick the recipient (a unit or a staff member), then [Send Distribution Request](#). The row now shows **Pending Approval**.
2. The recipient opens **Consume History** and on their own row clicks **Approve** or **Reject** (a rejection reason is required). Only then does the quantity count as distributed; a rejection releases it back to Available.
3. To record damage or wastage, use **Actions** → **Mark Lost** on the Item Consume row.

You can never distribute or mark lost more than the **Available** quantity — the app blocks it and shows both numbers. Only the receiving unit or person can approve or reject a request.

5. Distribution

Moving **durable stock** from one unit to another. The sender raises the transfer, and the named receiver must **Approve** it — only then is stock actually deducted from the sender and added to the receiver.

- Top button — [+ Distribute Items](#).
- Summary cards — **Total Distributions, Completed, Pending, Rejected**. Click any card to see that list.
- Filters — search, **All Status** (Pending / Completed / Rejected), a date range, and [Clear](#).
- Columns — S.No, Item, Category, Qty, Distributed By, Distributed To, Status, Date, Actions.
- Row actions — **Approve** and **Reject** (for the recipient), always **Details**. Rows you cannot act on show *Awaiting recipient*.

How to send stock

1. Click [+ Distribute Items](#).
2. Under **Distributed To**, open the dropdown and tick one or more recipients (or use **All**).
3. Choose **Type of Items** — **Stock** or **Consumable**.
4. Under **Items**, click [+ Add Item](#) and fill in each row (category, item, quantities by condition). You can attach **Photos / Attachments** and add **Remarks**.
5. Click [Submit Distribution](#). One record is created per recipient, numbered like DIST-000001, with status **Pending**.
6. The recipient opens the row and clicks **Approve** (optional note) or **Reject** (reason required). Stock moves only on approval.

If you request more than is in stock, the app warns you with the available and requested numbers and asks you to confirm. A rejection is final — a rejected record cannot be approved later.

6. Maintenance

Raise and track repair / maintenance requests for your unit. Every request is **routed automatically by type** — Computer / IT goes to the district's Computer/IT Staff, Vehicle to the MTO Staff, and everything else to the District Admin — and moves through **Pending** → **Under Process** → **Completed**.

- Top button — [+ New Request](#) .
- Filters — search, **All Status** (Pending / Under Process / Completed), **All Types** (Plumber, Electrician, Carpenter, Mason / Civil Work, Computer / IT, Vehicle, Other), a date range, and [Clear](#) .
- Columns — Request ID, Request To, Requesting Unit, Request Type, Description, Status, Created At, Action. Newest first.
- Row actions — **Process** (on a pending request you may act on), **Approve** (on an under-process one), and **Details** (always). Where you cannot act, the cell shows *Awaiting admin* or *In progress*.

Raising a request

1. Click [+ New Request](#) .
2. Choose the **Maintenance Type** (required). Picking **Other** reveals a box to type the type yourself.
3. Check **Request To** — it fills in automatically based on the type you picked.
4. Write the **Description** (required, at least 10 characters).
5. Optionally attach **Photos** using **Upload** or **Camera**.
6. Click [Submit Request](#) . You get a new ID like MR-000001.

Working a request

1. Click **Process** on a Pending row, add an optional remark, then [Proceed to Process](#) — status becomes **Under Process**.
2. Click **Approve** on an Under Process row, add an optional completion remark, then [Approve & Complete](#) — status becomes **Completed**.
3. Click **Details** on any row to see the full record, its photos, and the **Timeline** of who did what and when.

A pending request can be processed only by the person it is addressed to; an under-process request can be approved only by the requesting unit. Completed requests can no longer be changed. The Developer Admin has read-only access [here](#).

You can attach up to **4 photos** to a maintenance request. The **Camera** button falls back to a file picker automatically if no camera is available.

7. Demands

Formal requests for material from another district or post.

- [+ Raise Demand](#) — select item, quantity, category, condition, urgency (normal / urgent / critical), reason, and the destination district + location.
- **Summary cards** — Total / Pending / Approved / Rejected; click any one to jump to that filtered list.
- **Search & filter** — by text, status, and date range.
- **Reviewing (on the receiving side):** open a pending demand, see the full details, then **Approve & Submit** or **Reject** (a rejection reason is required).
- **Download / Print** — PDF, Excel, Word or Print.

When you raise a demand, the target district's admin gets a notification under the 🔔 bell, and a red dot appears on the Demands icon until it is reviewed.

8. Inspections

Records of asset inspections (Routine / Special / Annual).

- [+ New Inspection](#) — item/asset, inspected by, type, date, location, findings, recommendations, status.
 - **Summary cards** — Total / Completed / Pending / Overdue; click any one to filter.
 - **Search & filter** — by text, type, and status.
 - **Download / Print** — PDF, Excel, Word or Print.
-

9. Item Issued

Issue items to personnel and track returns. One rule governs the whole screen: **Total Qty = Available + Issued + Damaged / Lost**. You can never issue more than what is currently available, and quantities can never go negative.

- Top buttons — [+ Issue Items](#), [Import from Excel](#), [Scan & Import](#), [Scans](#).
- Two tabs — **Issued Items** and **Return History**. (The item stock list lives on the **Inventory** screen now.)

Issued Items tab

- Columns — S.No, Name, BELT No., Mobile No., Item, Category, Qty, Lost, Date, Time, Status, Actions. Click a heading to sort.
- Filters — search, **All Categories**, **All Items**, **Posting**, **All Ranks**, **All Status** (Issued, Partially Returned, Partially Recovered, Returned, Lost, Scrap, Cancelled), a date range, and [Clear](#).
- Clicking the person's **Name** opens their full profile (section 10).

Return History tab

- Columns — S.No, Person, BELT No., Item, Qty Returned, Condition, Return Date, Return Time, Received By, Remarks.
- Filter by text, then [Download / Print](#) for PDF, Excel, Word or Print.

Issuing items

1. Click [+ Issue Items](#) at the top of the Item Issued screen (or the Inventory screen).
2. In **Person details**, start typing a name or BELT number — matching personnel appear for instant fill. Otherwise enter name, post/rank, BELT number, and posting.
3. Under **Item details**, pick a **Category** first — only then does the **Item** drop-down unlock, showing just the items in that category. Choose the item; balance chips show its Total / Available / Issued.
4. Enter the item **Quantity**. You can issue items from **different categories and quantities in one go**: press [+ Add Item](#) to add more rows (Category → Item → Qty each). Remove a row with the **x** in its corner.
5. If any quantity exceeds the available stock, you get *"Insufficient stock for ... Only X units available."*
6. Set date/time (usually today) and optional remarks, then press [Issue Items](#) — every row is issued together under one issue record.

After an issue is saved it is locked: you can only change the **quantity**. Person details, item, category, date, time and remarks can no longer be edited.

Editing, cancelling and returns

- **Edit** on an active issue record — only the **quantity** can be changed (never below what has already been returned). Everything else is greyed out. Increasing the quantity re-checks available stock.
- **Cancel** — closes the issue record and returns the remaining units to stock.
- **Return** — enter the **Return Quantity** (partial returns are allowed) and choose the **Condition** on return: **Good** (adds the units back to available), **Damaged**, **Lost** or **Other**. Stock figures update immediately and the return appears in Return History.

Issued items respect the same role limits as the rest of the app: who can issue, edit, return and cancel is controlled by the user's role, and station/post users only ever see their own location's data.

10. Item Profile & Person Profile

Two full-history screens. Nothing is typed here — every row is computed from the existing issue records, stock history, demands and distributions.

Item Profile — everything about one item

- **How to open it:** click the blue **item name** link in the Inventory table (also works in Consumable Items, Distribution, Demands and Reports), or use **Actions ▸ View** and then **Open Full Profile**.
- Top row — a breadcrumb, a status badge (**Available / Low / Fully Issued / Out of Stock**), and chips for Item Code, Category, Unit, Location, District and Min Stock. Buttons: **Edit Item** (if you are allowed) and **Adjust Stock**.
- **Number cards** — TOTAL, AVAILABLE, ISSUED, RETURNED, LOST, SCRAP, GOOD, DAMAGED, RECOVERED.
- **Sections** — Item Information, Complete Transaction History, Item Activity Timeline, Uploaded Photos.
- **History columns** — Date & Time, Transaction Type, Reference, From, To, Quantity, Condition, Balance, Performed By, Remarks. Click a heading to sort; click a row to see the previous and new balance.
- **Filters** — search, All Types, All Conditions, date range, User / Unit, rows per page, and **Export / Download** (CSV, Excel, PDF, Print) for either the filtered rows or the complete history.
- **Photos** — **Upload Photo** or **Camera**, click a thumbnail to zoom. Up to **20 photos**, 8 MB each.

Person Profile — everything about one officer

- **How to open it:** click the person's **Name** in Item Issued → Issued Items, or the **Person** in Return History.
- Top row — breadcrumb, rank badge, and chips for Belt No., Posting, Mobile, District, Designation. Buttons: **Edit Details** and **Issue Item**.
- **Number cards** — ISSUES, TOTAL ISSUED, RETURNED, PARTIAL RETURN, LOST, CURRENTLY HELD, DIFFERENT ITEMS, PENDING RETURNS, RECOVERED.
- **Sections** — Active Holdings, Person Item History, Complete Issue / Return & Lost Audit, Photo History.
- **History columns** — Date & Time, Item, Transaction Type, Quantity, Reference, Issued By, Processed By, Condition, Remark, Action. Item names here open that item's profile.
- **Filters** — search, All Types, All Categories, All Items, All Conditions, date range, **Clear Filters**, and **Export / Download**.

Rows tagged **“derived”** are worked out by the app from current records — nobody entered them. A trailing **SYSTEM SYNC** row reconciles the running balance to the present stock figure.

You can only open profiles inside your own district (Developer Admin excepted). Mobile numbers read **Restricted** for non-admin users, and photos can be uploaded only by the owning unit or a District Admin.

11. Scan & Import (OCR)

Automatically read a filled application or receipt and let the app fill in an issue record for you — always with a human verification step before anything is saved. The button [Scan & Import](#) is on the **Item Issued** screen; [Scans](#) shows every document you have imported.

Supported formats

Images (JPG / PNG / WebP / BMP), PDF (text or scanned), Word (DOCX), Excel (XLSX), and TXT / CSV. The reading is done **in your browser** — the file is not uploaded before you confirm it.

How it works

1. Click [Scan & Import](#), then click or drag a file onto the upload box.
2. Press [Scan Document](#). The app reads the document (progress is shown; the OCR model downloads once on first use) and extracts person details — **Name, Post / Rank, BELT No., Posting** — and the **Items + Quantities** by matching against your item list.
3. The **Review & Verify** screen opens with every field pre-filled and **editable**. Correct anything the computer misread, add or remove item rows, and check the **Raw extracted text** panel to compare with the original.
4. Only when you press [Verify & Insert Data](#) is anything saved: the person is created (if new), the issue appears in **Issued Items**, and item stock is reduced — exactly as if you issued it manually.
5. The original document is stored with the record. Open [Scans](#) → [View](#) to see or download the original file, the person it was issued to, the items, date, and who verified it.

Items are matched by name, so scanned items must already exist in your inventory to be recognised. A quantity that exceeds available stock is blocked at verification, just like a manual issue. Nothing is ever inserted without your confirmation.

12. Reports

Three ready-made reports. Reports respect your role — for example a post or station user only ever sees their own location's data in every report and export.

- **Stock Report** — current stock position by item, with clickable summary cards: **Total Items**, **In Stock**, **Low Stock**, **Out of Stock**, **Good Units**, **Poor Units**, and **Damaged Units**. Click any card to open a detail table of exactly those items.
- **Category Breakdown** — items grouped by category with quantities.
- **Location Report** — stock grouped by location / station.
- **Search** — type in the search box to filter the current report instantly.
- **Columns** ▾ — tick or untick columns to show only what you need, and drag column headings to reorder them.
- **Download / Print** ▾ — export as **PDF**, **Excel** or **Word**, or print. Every report table has a bold **Total** row, and it is included in the export and print.

Admin tools on this screen

- **Audit Log** (District Admin and Developer Admin) — who changed what, and when.
- **Backup (JSON)**, **Backup (Excel)** and **Restore Data** (Developer Admin only) — save a full copy of the system data, or load one back.

13. Notifications (Bell)

Click the bell in the top bar to open the notifications panel. The red number shows unread items.

- You are notified about **access requests**, **password reset requests**, **new demands**, **new distributions** and their approval, **new consumable distribution requests**, and **maintenance requests** (new, under process, completed).
- Use **Mark all read** to clear the counter, and **View all** to see the complete list.
- An admin can act directly on an access request from the panel itself — **Approve** or **Reject** — while it is still pending.
- Clicking a notification takes you straight to the relevant screen (maintenance, demands, inventory, users).

Notification scope: the Developer Admin sees notifications across all districts (30 most recent); other users see only their own district, filtered to their own location or user.

14. Users, Districts & Locations

These screens live under the gold **Manage ▾** menu in the top bar. What you can see depends on your role.

- **Manage Districts** (Developer Admin) — add new districts; search by name, code or headquarters.
- **Manage Users** (Developer Admin) — two lists: **District Admins** and **Developer Admins**. From a District Admin row you can open **Users** to see the non-admin accounts under them, or **Edit** / **Delete** the account.
- **Manage Locations** (District Admin) — add and remove your district's locations and stations. The district and its headquarters cannot be deleted.
- **Manage Users** (District Admin) — create, edit or remove accounts inside your own district. Columns: Username, Display Name, Mobile, Role, District, Location.
- The **District selector** in the top bar lets the Developer Admin switch which district is being viewed; every other user is locked to their own district.

Only create accounts for people who genuinely need access. Admin accounts are powerful — never create admin accounts for general staff.

15. Roles at a Glance

Role	Typical use
Developer Admin	Everything, all districts. Manages districts, district admins and locations. Read-only on inventory data, maintenance and profiles.
District Admin	Full control within own district; manages that district's users, locations and demands; approves distributions.
Station Manager	Manages station-level inventory, transactions and issued items in own district.
Staff	General staff of a unit; day-to-day entries within own location.
MHC	Records material/MHC entries, inspections, and can issue items and process returns.
TSI	Telecom / Signals inventory operator within their district.
Computer/IT Staff	Receives maintenance requests of type Computer / IT automatically.
MTO Staff	Receives maintenance requests of type Vehicle automatically.
Police Post	View and manage inventory, transactions and issued items for a post.
General User	Viewing data for their district; can raise demands.

Computer/IT Staff and MTO Staff accounts are created automatically for each district and are not offered in the manual role dropdown. They land straight on the Maintenance screen after logging in.

16. Good Practices & Language

- **Language** — the **हिन्दी / English** button in the top bar switches the whole app between Hindi and English. Your choice is remembered for next time.
- Always press **Logout** on a shared device.
- Keep your password private — it is stored hashed and cannot be read by anyone.
- Use **Forgot Password?** on the login screen if you need a reset; the admin is notified automatically.
- Wrong login? Passwords are checked server-side; repeated failures are rate-limited for your protection.
- Back up `local-data\db.json` regularly, or use **Backup** in Reports if you are the Developer Admin.
